

Active Directory Integration

NetFortris Active Directory allows customers to maintain their username and passwords in their Active Directory or LDAP service. This free service lets users log into CommUnity interfaces using their company login credentials, no longer requiring separate credentials.

BENEFITS

- One password to access both network resources and NetFortris applications
- Improves security by ensuring logins adhere to company password policies
- Easier to manage NetFortris access within LDAP systems

FEATURES

- Login to CommUnity with company credentials
- Configure multiple LDAPs
- Easy synchronization, right from your administration panel

WHY SINGLE SIGN ON

- **REDUCED ADMIN COSTS**
With fewer passwords to manage, system administrators receive fewer requests to reset forgotten passwords.
- **INCREASED USER ADOPTION**
Due to the convenience of not having to log in, users are more likely to use NetFortris and any integrated products on a regular basis.
- **TIME SAVINGS**
On average, a user takes five to twenty seconds to log in to an online application; longer if they mistype their username or password. With single sign-on in place, the need to manually login to NetFortris is avoided.
- **INCREASED USER SECURITY**
Any password policies that customers have established for their corporate network will also be in effect for NetFortris.

HOW DO I GET STARTED?

- 1 Log into your Administration Panel and navigate to 'Active Directory'
- 2 Configure your company LDAP information
- 3 Sync services to your CommUnity user accounts
- 4 You're all set!
